

Abstract of the Disclosure

A flexible substrate (21) can support both a flexible active display (31) and a flexible audio transducer (22). When not in use the flexible substrate can be reconfigured into a non-deployed form factor. For example, the flexible substrate (and hence the corresponding display and audio transducer) can be folded or rolled up to permit compact storage of same. Multiple flexible audio transducers can be provided in this fashion. If desired, an acoustic damper (71) can be employed to acoustically isolate the audio transducer from the display.
